

Encanto Potash

Saskatchewan, Canada

Encanto Resources is developing a potash project located approximately 100 kilometers (km) north-northeast of Regina, namely The Muskowekwan prospect. Novopro Projects Inc. has been involved in completing a scoping study for Encanto in 2011 and is mandated to prepare a pre-feasibility study which was initiated in March 2012.

The project is planning to use solution mining to recover potash from the ore body. The potash is then processed by evaporation and crystallization producing at least 2.5 million tons of granulated and standard product, which will be shipped by rail primarily to the west coast for export shipping.

In addition to preparing all the engineering aspects of the project Novopro is charged with coordinating all other contractors including testing, mining, and environment.
